

KFC UK

Setting the scene

As a manufacturer with a varied, global distribution network, we often work on a number of interesting projects. A recent installation saw one of our partners, an expert in commercial kitchen installations install our 300 litre integrated system in a KFC restaurant in the UK. Its always great to see established brands pick up establishments but what is really interesting in this instance is how KFC have looked to make the most of how the evaporater panel works.

By installing the panel internally within the kitchen area, the system will benefit from the additional ambient temperatures found within this environment. This sees the heat pump benefit from slightly faster heat-up times whilst at the same time the panel, which naturally generates a frosted condense as the refrigerant passes through it, will go some way to cool the kitchen down.
